

Captured Hollowing Tool By Dave Lee

This is a knock off copy of Steve Sinner's bar for deep boring. Steve uses two one inch solid bars welded together which I thought was heavier than necessary. I had some one inch square tubing which I welded together. Inside one of the square tubes I inserted a three bar of solid steel. At the end of the steel I attached a "Woodcut" cutter which shaves rather than scrapes. Notice the shavings in the picture. The free standing tripod and sliding rails on top are necessary to keep the bar from turning as you are cutting. The boring can be done much, much faster with very little fatigue.
